

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0579-0036. The time required to complete this information collection is estimated to average 2 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

OMB APPROVED
0579-0036
Exp.: 10/31/2018

This report is required by law (7 U.S.C. 2143). Failure to report according to the regulations can result in an order to cease and desist and to be subject to penalties as provided for in Section 2150.

3. REPORTING FACILITY (List all locations where animals were housed or used in actual research, testing, teaching, or experimentation, or held for these purposes. Attach additional sheets, if necessary.)

FACILITY LOCATIONS (Sites)

(b)(7)(F)

REPORT OF ANIMALS USED BY OR UNDER CONTROL OF RESEARCH FACILITY (Attach additional sheets, if necessary, or use APHIS FORM 7023A.)

A. Animals Covered By The Animal Welfare Regulations	B. Number of animals being bred, conditioned, or held for use in teaching, testing, experiments, research, or surgery but not yet used for such purposes.	C. Number of animals upon which teaching, research, experiments, or tests were conducted involving no pain, distress, or use of pain-relieving drugs.	D. Number of animals upon which experiments, teaching, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which appropriate anesthetic, analgesic, or tranquilizing drugs were used.	E. Number of animals upon which teaching, experiments, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which the use of appropriate anesthetic, analgesic, or tranquilizing drugs would have adversely affected the procedures, results, or interpretation of the teaching, research, experiments, surgery, or tests. (An explanation of the procedures producing pain or distress on these animals and the reasons such drugs were not used must be attached to this report.)	F. TOTAL NUMBER OF ANIMALS (Cols. C + D + E)
4. Dogs	0	0	0	0	0
5. Cats	0	0	0	0	0
6. Guinea Pigs	0	0	0	0	0
7. Hamsters	0	0	0	0	0

10. Sheep	0	0	0	0	0
11. Pigs	0	0	0	0	0
12. Other Farm Animals					
13. Other Animals					

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- Each principal investigator has considered alternatives to painful procedures.
- This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- Each principal investigator has considered alternatives to painful procedures.
- This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- Each principal investigator has considered alternatives to painful procedures.
- This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

CONTINUATION SHEET FOR ANNUAL REPORT OF RESEARCH FACILITY

(TYPE OR PRINT)

ARCATA, CA 95521

[illegible]

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). **A summary of all such exceptions is attached to this annual report.** In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

I certify that the above is true, correct, and complete (7 U.S.C. Section 2143).

DATE SIGNED
07-JAN-2015

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0579-0036. The time required to complete this information collection is estimated to average 2 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

OMB APPROVED
0579-0036
Exp.: 10/31/2018

This report is required by law (7 U.S.C. 2143). Failure to report according to the regulations can result in an order to cease and desist and to be subject to penalties as provided for in Section 2150.

ANNUAL REPORT OF RESEARCH FACILITY
(TYPE OR PRINT)

1. REGISTRATION NUMBER

93-R-0421

2. HEADQUARTERS RESEARCH FACILITY (Name, address, and telephone number as registered with USDA, include ZIP Code)

CALIFORNIA STATE POLYTECHNIC UNIVERSITY- POMONA
3801 WEST TEMPLE AVENUE

POMONA, CA 91768

3. REPORTING FACILITY (List all locations where animals were housed or used in actual research, testing, teaching, or experimentation, or held for these purposes. Attach additional sheets, if necessary.)

FACILITY LOCATIONS (Sites)

(b)(7)(F)

REPORT OF ANIMALS USED BY OR UNDER CONTROL OF RESEARCH FACILITY (Attach additional sheets, if necessary, or use APHIS FORM 7023A.)

A. Animals Covered By The Animal Welfare Regulations	B. Number of animals being bred, conditioned, or held for use in teaching, testing, experiments, research, or surgery but not yet used for such purposes.	C. Number of animals upon which teaching, research, experiments, or tests were conducted involving no pain, distress, or use of pain-relieving drugs.	D. Number of animals upon which experiments, teaching, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which appropriate anesthetic, analgesic, or tranquilizing drugs were used.	E. Number of animals upon which teaching, experiments, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which the use of appropriate anesthetic, analgesic, or tranquilizing drugs would have adversely affected the procedures, results, or interpretation of the teaching, research, experiments, surgery, or tests. (An explanation of the procedures producing pain or distress on these animals and the reasons such drugs were not used must be attached to this report.)	F. TOTAL NUMBER OF ANIMALS (Cols. C + D + E)
4. Dogs	0	0	0	0	0
5. Cats	0	0	0	0	0
6. Guinea Pigs	0	0	0	0	0
7. Hamsters	0	0	0	0	0
8. Rabbits	0	26	0	0	26
9. Non-human Primates	0	0	0	0	0
10. Sheep	0	12	0	0	12
11. Pigs	0	20	0	0	20
12. Other Farm Animals	0	49	0	0	49
13. Other Animals					

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

CERTIFICATION BY HEADQUARTERS RESEARCH FACILITY OFFICIAL

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

[illegible]

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). **A summary of all such exceptions is attached to this annual report.** In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

I certify that the above is true, correct, and complete (7 U.S.C. Section 2143).

DATE SIGNED
26-FEB-2015

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0579-0036. The time required to complete this information collection is estimated to average 2 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

OMB APPROVED
0579-0036
Exp.: 10/31/2018

This report is required by law (7 U.S.C. 2143). Failure to report according to the regulations can result in an order to cease and desist and to be subject to penalties as provided for in Section 2150.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

ANNUAL REPORT OF RESEARCH FACILITY
(TYPE OR PRINT)

1. REGISTRATION NUMBER
93-R-0485

2. HEADQUARTERS RESEARCH FACILITY (Name, address, and telephone number as registered with USDA, include ZIP Code)

GENOMICS INST. OF THE NOVARTIS RESEACH FOUNDATION
10675 JOHN JAY HOPKINS DRIVE

SAN DIEGO, CA 92121

3. REPORTING FACILITY (List all locations where animals were housed or used in actual research, testing, teaching, or experimentation, or held for these purposes. Attach additional sheets, if necessary.)

FACILITY LOCATIONS (Sites)

(b)(7)(F)

REPORT OF ANIMALS USED BY OR UNDER CONTROL OF RESEARCH FACILITY (Attach additional sheets, if necessary, or use APHIS FORM 7023A.)

A. Animals Covered By The Animal Welfare Regulations	B. Number of animals being bred, conditioned, or held for use in teaching, testing, experiments, research, or surgery but not yet used for such purposes.	C. Number of animals upon which teaching, research, experiments, or tests were conducted involving no pain, distress, or use of pain-relieving drugs.	D. Number of animals upon which experiments, teaching, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which appropriate anesthetic, analgesic, or tranquilizing drugs were used.	E. Number of animals upon which teaching, experiments, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which the use of appropriate anesthetic, analgesic, or tranquilizing drugs would have adversely affected the procedures, results, or interpretation of the teaching, research, experiments, surgery, or tests. (An explanation of the procedures producing pain or distress on these animals and the reasons such drugs were not used must be attached to this report.)	F. TOTAL NUMBER OF ANIMALS (Cols. C + D + E)
4. Dogs	0	0	0	0	0
5. Cats	0	0	0	0	0
6. Guinea Pigs	0	0	0	0	0
7. Hamsters	0	0	129	0	129
8. Rabbits	0	0	0	0	0
9. Non-human Primates	0	0	0	0	0
10. Sheep	0	0	0	0	0
11. Pigs	0	0	0	0	0
12. Other Farm Animals					
13. Other Animals					

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

CERTIFICATION BY HEADQUARTERS RESEARCH FACILITY OFFICIAL
(Chief Executive Officer (C.E.O.) or Legally Responsible Institutional Official (I.O.))

I certify that the above is true, correct, and complete (7 U.S.C. Section 2143).

SIGNATURE OF C.E.O. OR I.O.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0579-0036. The time required to complete this information collection is estimated to average 2 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

OMB APPROVED
0579-0036
Exp.: 10/31/2018

This report is required by law (7 U.S.C. 2143). Failure to report according to the regulations can result in an order to cease and desist and to be subject to penalties as provided for in Section 2150.

AMPHASTAR LABORATORIES INC.

11570 6TH STREET

RANCHO CUCAMONGA, CA 91730

3. REPORTING FACILITY (List all locations where animals were housed or used in actual research, testing, teaching, or experimentation, or held for these purposes. Attach additional sheets, if necessary.)

FACILITY LOCATIONS (Sites)

(b)(7)(F)

REPORT OF ANIMALS USED BY OR UNDER CONTROL OF RESEARCH FACILITY (Attach additional sheets, if necessary, or use APHIS FORM 7023A.)

A. Animals Covered By The Animal Welfare Regulations	B. Number of animals being bred, conditioned, or held for use in teaching, testing, experiments, research, or surgery but not yet used for such purposes.	C. Number of animals upon which teaching, research, experiments, or tests were conducted involving no pain, distress, or use of pain-relieving drugs.	D. Number of animals upon which experiments, teaching, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which appropriate anesthetic, analgesic, or tranquilizing drugs were used.	E. Number of animals upon which teaching, experiments, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which the use of appropriate anesthetic, analgesic, or tranquilizing drugs would have adversely affected the procedures, results, or interpretation of the teaching, research, experiments, surgery, or tests. (An explanation of the procedures producing pain or distress on these animals and the reasons such drugs were not used must be attached to this report.)	F. TOTAL NUMBER OF ANIMALS (Cols. C + D + E)
4. Dogs	2	0	0	0	0
5. Cats	0	0	0	0	0
6. Guinea Pigs	0	0	0	0	0
7. Hamsters	0	0	0	0	0

10. Sheep	0	0	0	0	0
11. Pigs	0	0	0	0	0
12. Other Farm Animals					
13. Other Animals					

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- Each principal investigator has considered alternatives to painful procedures.
- This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

2. HEADQUARTERS RESEARCH FACILITY (Name, address, and telephone number as registered with USDA, include ZIP Code)

COLLEGE OF THE SEQUOIAS
4999 East Bardsley Avenue

TULARE, CA 93274

3. REPORTING FACILITY (List all locations where animals were housed or used in actual research, testing, teaching, or experimentation, or held for these purposes. Attach additional sheets, if necessary.)

FACILITY LOCATIONS (Sites)

(b)(7)(F)

REPORT OF ANIMALS USED BY OR UNDER CONTROL OF RESEARCH FACILITY (Attach additional sheets, if necessary, or use APHIS FORM 7023A.)

A. Animals Covered By The Animal Welfare Regulations	B. Number of animals being bred, conditioned, or held for use in teaching, testing, experiments, research, or surgery but not yet used for such purposes.	C. Number of animals upon which teaching, research, experiments, or tests were conducted involving no pain, distress, or use of pain-relieving drugs.	D. Number of animals upon which experiments, teaching, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which appropriate anesthetic, analgesic, or tranquilizing drugs were used.	E. Number of animals upon which teaching, experiments, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which the use of appropriate anesthetic, analgesic, or tranquilizing drugs would have adversely affected the procedures, results, or interpretation of the teaching, research, experiments, surgery, or tests. (An explanation of the procedures producing pain or distress on these animals and the reasons such drugs were not used must be attached to this report.)	F. TOTAL NUMBER OF ANIMALS (Cols. C + D + E)
4. Dogs	0	0	0	0	0
5. Cats	0	0	0	0	0
6. Guinea Pigs	0	0	0	0	0
7. Hamsters	0	0	0	0	0
8. Rabbits	0	0	0	0	0
9. Non-human Primates	0	0	0	0	0
10. Sheep	0	0	0	0	0
11. Pigs	0	0	0	0	0
12. Other Farm Animals					
13. Other Animals					

ASSURANCE STATEMENTS

- Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- Each principal investigator has considered alternatives to painful procedures.
- This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

ASSURANCE STATEMENTS

- Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- Each principal investigator has considered alternatives to painful procedures.
- This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

UNITED STATES DEPARTMENT OF AGRICULTURE
ANIMAL AND PLANT HEALTH INSPECTION SERVICE

ANNUAL REPORT OF RESEARCH FACILITY
(TYPE OR PRINT)

1. REGISTRATION NUMBER
93-V-0004

2. HEADQUARTERS RESEARCH FACILITY (Name, address, and telephone number as registered with USDA, include ZIP Code)

VA ANIMAL RESEARCH FACILITY #664 - SAN DIEGO
3350 LA JOLLA VILLAGE DRIVE

SAN DIEGO, CA 92161

3. REPORTING FACILITY (List all locations where animals were housed or used in actual research, testing, teaching, or experimentation, or held for these purposes. Attach additional sheets, if necessary.)

FACILITY LOCATIONS (Sites)

(b)(7)(F)

REPORT OF ANIMALS USED BY OR UNDER CONTROL OF RESEARCH FACILITY (Attach additional sheets, if necessary, or use APHIS FORM 7023A.)

A. Animals Covered By The Animal Welfare Regulations	B. Number of animals being bred, conditioned, or held for use in teaching, testing, experiments, research, or surgery but not yet used for such purposes.	C. Number of animals upon which teaching, research, experiments, or tests were conducted involving no pain, distress, or use of pain-relieving drugs.	D. Number of animals upon which experiments, teaching, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which appropriate anesthetic, analgesic, or tranquilizing drugs were used.	E. Number of animals upon which teaching, experiments, research, surgery, or tests were conducted involving accompanying pain or distress to the animals and for which the use of appropriate anesthetic, analgesic, or tranquilizing drugs would have adversely affected the procedures, results, or interpretation of the teaching, research, experiments, surgery, or tests. (An explanation of the procedures producing pain or distress on these animals and the reasons such drugs were not used must be attached to this report.)	F. TOTAL NUMBER OF ANIMALS (Cols. C + D + E)
4. Dogs	0	0	0	0	0
5. Cats	0	0	0	0	0
6. Guinea Pigs	0	0	3	0	3
7. Hamsters	0	0	0	0	0
8. Rabbits	0	0	58	0	58
9. Non-human Primates	0	0	0	0	0
10. Sheep	0	0	0	0	0
11. Pigs	0	0	0	0	0
12. Other Farm Animals					
13. Other Animals					

ASSURANCE STATEMENTS

- 1.) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2.) Each principal investigator has considered alternatives to painful procedures.
- 3.) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4.) The attending veterinarian for this research facility has appropriate authority to ensure the provisions of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

CERTIFICATION BY HEADQUARTERS RESEARCH FACILITY OFFICIAL
(Chief Executive Officer (C.E.O.) or Legally Responsible Institutional Official (I.O.))

I certify that the above is true, correct, and complete (7 U.S.C. Section 2143).

SIGNATURE OF C.E.O. OR I.O.

NAME AND TITLE OF C.E.O. OR I.O. (Type or Print)

DATE SIGNED

(b)(6), (b)(7)(c)

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0579-0036. The time required to complete this information collection is estimated to average 2 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

OMB APPROVED
0579-0036
Exp.: 10/31/2018

This report is required by law (7 U.S.C. 2143). Failure to report according to the regulations can result in an order to cease and desist and to be subject to penalties as provided for in Section 2150.

NAME AND TITLE OF C.E.O. OR I.O. (Type or Print)

DATE SIGNED
12-JAN-2015

(b)(6), (b)(7)(c)

JUL 2013

Column E Explanation

1. Registration Number: 93-R-0015
2. Number of animals used in these studies: 30
3. Species (common name) of animals used in the study: Cotton Rats

4. Explain the procedure producing pain and/or distress.

The cotton rats received an injection of iron dextran as well as infection with Tacaribe virus (Arenavirus). The iron dextran was intended to reduce the viral infection rate. While the dose of iron dextran administered has been used in other species rodents without any evidence of pain or distress, it was unexpectedly associated with morbidity (8 animals) and mortality (1 animal) when used prior to Tacaribe virus infection in cotton rats. The 8 cotton rats that were observed with clinical signs (acute weight loss and red ocular discharge) were immediately euthanatized prior to reaching the experimental endpoint. The single animal that died acutely prior to observation of clinical signs is classified as category E as it likely experienced pain and/or distress prior to death. The remainder of the animals that were injected with a lower dose of iron dextran, or without iron dextran did not show evidence of pain or distress prior to euthanasia.

5. Provide scientific justification why pain and/or distress could not be relieved. State methods or means used to determine that pain and/or distress relief would interfere with test results. (For Federally mandated testing, see Item 6 below).

While infection of wild rodents with Tacaribe virus does not cause disease, its ability to cause clinical disease in the cotton rat (*Sigmodon fulviventer*) is unknown. It is also unknown whether clinical disease would cause significant pain and/or distress. The use of drugs to relieve pain and/or distress associated with infectious disease has been shown to interfere with research results and thus administration of analgesics were contraindicated in this study.

6. What, if any, federal regulations require this procedure? Cite the agency, the code of Federal Regulations (CFR) title number and the specific section number (e.g., APHIS, 9 CFR 113.102):

Agency: NA CFR: NA

DEC 23 2014

Column E Explanation

1. Registration Number: 93-R-0026
2. Number of animals used in these studies: 44
3. Species (common name) of animals used in this study: *Saimiri sciureus*
4. Explain the procedure producing pain and/or distress:

The potential for distress involves the administration of a neurotoxin for the purpose of creating an animal model of a central nervous system movement disorder and the secondary dyskinesias which are adverse complications of long term medical therapy for the neurological disorder. The neurotoxic drug may also have short term effects (days) on liver metabolism with resulting malaise.

5. Provide scientific justification why pain and/or distress could not be relieved. State methods or means used to determine that pain and/or distress relief would interfere with test results. (For Federally mandated testing, see Item 6 below).

The goal of these studies is to identify treatments for the primary central nervous system disorder and the secondary dyskinesias caused by our current medical regimens. Such work is only possible in an animal model. Use of sedatives or tranquilizers is not possible because the effects of these agents on the movement/coordination of the animals would interfere with the movement assays we use to determine efficacy of our novel treatments and thus would interfere with the results of our investigations. Analgesics are not considered to be drugs of choice for treatment of malaise in these animals as they can increase clinical lethargy and further depress the sensorium, exacerbating and further compromising the animal's clinical condition. We actively review current scientific literature, attend relevant scientific conferences, and discuss our findings and studies with experts in the field to assure that we are using the most refined methods on the fewest number of animals of the most appropriate species.

6. What, if federal regulations require this procedure? Cite the agency, the code of Federal Regulations (CFR) title number and the specific number (e.g. APHIS, 9 CFR 113.102):

Not applicable.

Column E Explanation

This form is intended as an aid to completing the Column E explanation. It is not an official form and its use is voluntary. Names, addresses, protocols, veterinary care programs, and the like are not required as part of an explanation. A Column E explanation must be written so as to be understood by lay persons as well as scientists.

1. Registration Number: **93-R-0032**
2. Number of animals used in this study: **69**
3. Species (common name) of animals used in this study: **Rabbits**
4. Explain the procedure producing pain and/or distress:

There is one protocol that uses rabbits for stroke research. The purpose of the research is to evaluate new therapeutics for the treatment of stroke. A minor surgery is performed under inhaled anesthesia to place a cannula into the common carotid artery near the internal carotid artery directed toward the brain. After the rabbit has recovered from surgery for 2-3 hours, it undergoes a conscious embolization procedure. Non-autologous blood clots are prepared from a donor rabbit. Small or large blood clots are prepared and suspended in saline for injection. The clots, which are labeled with Cobalt 57 (Co57) microspheres (to allow for tracking of clot deposition in brain), are then injected through the carotid catheter into the brain to induce a stroke, either representing a lacunar small vessel stroke or a large vessel stroke.

The Principal Investigator (P.I.), reported to the Institutional Animal Care & Use Committee (IACUC) that, although this procedure is done in conscious rabbits, it is his opinion that strokes are not painful since the brain does not have nociceptive receptors, and ischemic strokes are not associated with pain in humans, and in animals that have previously undergone the procedure, there is no indication by observation of any pain with the embolization.

Nevertheless, the IACUC requested additional information about the rabbits' responses to the embolization procedure. The P.I. noted that the typical initial response of a rabbit to the stroke is vocalization in some rabbits; nystagmus occurs in many rabbits; and occasionally rabbits will kick in the restrainer, briefly. The P.I. noted that he does not think that the vocalization is a result of the rabbit being in pain or distress, but rather a new sensation of a clot being lodged in a vessel in the brain.

The IACUC required the P.I. to perform a pilot study to compare the results of the embolization procedure performed in isoflurane anesthetized rabbits versus unanesthetized rabbits. In addition, IACUC members have observed the procedures.

DEC 1 - 2014

5. Provide scientific justification why pain and/or distress could not be relieved. State methods or means used to determine that pain and/or distress relief would interfere with test results. (For Federally mandated testing, see item 6 below.)

A presentation to the IACUC by the P.I. included several references that noted that translational stroke research in "animal models" should simulate as closely as possible "human stroke," which is frequently caused by permanent vascular obstruction by a blood clot (i.e., an embolic stroke). Stroke victims are rarely anesthetized at the time of their embolic stroke. An animal model that limits the use of any anesthetic closely simulates human stroke will lead to successful identification of drugs or therapies to treat human stroke. To accurately model human stroke, the use of anesthetics should be limited. Anesthetics can interfere with the pathophysiological mechanisms and stroke cascade. Research indicates that anesthetics will obscure or interact (negative, additive or synergistic) with the drug being investigated in any particular study.

Based upon the Pilot study to compare the results of the embolization procedure performed in isoflurane anesthetized rabbits versus unanesthetized rabbits, it was determined that the protocol would require the use of many more rabbits to achieve statistical significance, if the rabbits are anesthetized for the embolization.

93 R 0183
1138

Facility Registration: 93-R-0183
Certificate Number: 93-R-0183
Customer Number: 1138
Number of animals: 202
Species: Guinea Pig
Description/Explanation/Purpose

Two hundred and two guinea pigs were used to study potential proprietary therapeutics for treating a non-infectious inflammatory disease. Guinea pigs possess a more developed target organ system for study of this particular disease than mice and rats. Animals were sensitized by IP injection and challenged by exposure to an inciting agent to elicit a disease reaction. Analgesics were not used as they could have affected the results by interfering with the inflammatory response being studied and would not alleviate the symptoms associated with the disease. Narcotics are typically not used to treat this classification of disease. NSAIDS can suppress inflammatory processes, block platelet aggregation, and potentially cause a hypersensitivity reaction. Animals were continuously monitored daily during the period of morbidity.

EXPLANATION FOR COLUMN E LISTING

ICD: 9192

Registration Number: 93-R-0433

Animal Study Proposal Title: Determining the Efficacy and Cost of Pocket Gopher Control Practices in Alfalfa

Number and Species of Animals Listed in Column E:

Species: Gopher

Number: 90

Brief description of project including reason(s) for species selection:

This is an operational pest control project for which effective control of pocket gophers is warranted given extensive damage to alfalfa. This damage can lead to substantial losses in forage production and grower profits. The purpose of the study is to assess the efficacy and cost effectiveness of several control methods including trapping, fumigation, rodenticide application, and a Pressurized Exhaust Rodent Controller device. Understanding which control measures most effectively reduce gopher populations while minimizing costs could provide significant financial benefits to many growers in California and other adjacent states.

Species selection:

Pocket gophers are the most widespread and significant vertebrate pest problem in alfalfa. It is important to determine which control techniques are most efficacious and cost effective to maximize production of this extraordinarily valuable crop throughout the western U.S.

Justification for unrelieved pain or distress:

Lethal removal is currently the only effective method for controlling gophers in an agricultural/natural resource setting. Gophers dig burrows underground making monitoring gophers for lethal treatment strategies impractical and essentially impossible, therefore pain and distress cannot be ameliorated or alleviated.

For those methods that cause death by anoxia, death can be within a few hours or can occur very rapidly. Euthanasia of sick animals conflicts with the goal of the study since animals receiving a sublethal dose may become lethargic but still have the ability to recover. For tests of products claimed to eliminate vertebrate pests, death is the response that must be assessed as it is the endpoint claimed on the label and desired by the user. In efficacy studies involving rodenticide toxicants, it is fundamental that observations of animals continue until the animal succumbs completely to the poison (i.e., dies) or recovers.

Federal regulations requiring procedure:

Not applicable. However, all control methods used in this study conform to California Department of Fish and Wildlife and California Department of Pesticide Regulation code and are widely used and considered acceptable for gopher control.

NOV 28 2014

ICD: 9192

Registration Number: 93-R-0433

Animal Study Proposal Title: Field Efficacy of Several Methods for Applying 0.005% Diphacinone Pellets for California Ground Squirrel Control

Number and Species of Animals Listed in Column E:

Species: Ground squirrel

Number: 107

Brief description of project including reason(s) for species selection:

This is an operational pest control project for which effective control of California ground squirrels is warranted given their status as pests in crop areas, rangeland, and pastures, and the damage their burrows can cause to livestock and agriculture equipment. Additionally, ground squirrels are also known to be a vector of diseases that can infect humans. It is the purpose of this study to assess the efficacy of 0.005% Diphacinone using several application methods. The U.S. EPA requires field efficacy data as a condition of registration for pesticide products labeled for their control.

Species selection:

California ground squirrels were chosen as they are the species of interest. Ground squirrels are one of the most damaging wildlife pests in California. This damage includes, but is not limited to, disease transmission, loss of crop production, increased water loss, soil erosion from burrow systems, and potential hazards to farm equipment and laborers. This study will ensure a quantifiable value for efficacy for 0.005% Diphacinone pellets (using multiple application techniques) can be obtained which will provide the information growers and ranchers need to develop a more effective program for dealing with California ground squirrels, and will fulfill the requirements imposed by the U.S. EPA on the need for field efficacy data for the registration of this product to be used as a pesticide labeled for control of California ground squirrels.

Justification for unrelieved pain or distress:

Lethal controls such as rodenticides are currently the only effective methods for controlling ground squirrels over large areas. Ground squirrels dig burrows underground making monitoring of ground squirrels for lethal strategies impractical and essentially impossible, therefore pain and distress cannot be ameliorated or alleviated. Diphacinone is an anticoagulant that causes internal bleeding which is considered to be relatively painless as the animal becomes fatigued and slowly loses consciousness. In the unlikely event that a squirrel is found alive but injured, it will be collected and euthanized.

Federal regulation requiring procedure:

The U.S. EPA requires, as a condition of registration for pesticide products labeled for their control, field efficacy data on pests identified as public health concerns (for the purpose of this study, that pest is identified as the California ground squirrel). Therefore, it is the intent of this study to assess the efficacy of 0.005% Diphacinone using several application methods.

NOV 28 2014

9320433

The following information provided by Dr. William Jacobs, Jr., Environmental Protection Agency, serves as guidance documentation regarding efficacy testing of rodenticides.

From: Jacobs, William [mailto:Jacobs.Bill@epa.gov]
Sent: Tuesday, February 25, 2014 5:46 AM
To: (b) (6), (b) (7)
Cc: (b) (6), (b) (7)(C)
Subject: Death as endpoint in Diphacinone efficacy trial

The bottom lines to the issue remain the same as in prior responses.

1. The purpose of the research is to assess the performance of a rodenticide that is claimed to kill targeted species.
2. The research effort must not interfere with the determination that the claimed endpoint (death) has occurred due to the effects of the test material.
3. Animals dispatched by research personnel cannot be classified, with certainty, as having been fatally poisoned.
4. Animals that recover from exposure to the test material, whether symptomatic or not, are of great scientific interest as they represent failures of the agent to achieve its intended purpose. Such survivors may indicate that future research avenues should be explored, and the survivors themselves may be subjected to further study. If the survivors associate their illnesses with the flavor of a rodenticide bait, they are likely to resist the same bait if exposed to it subsequently. Such bait shyness seems unlikely with slow-acting agents such as Diphacinone, however.
5. If registered for the purpose for which it is now to be evaluated, the rodenticide ultimately will be used in attempts to poison many more examples of the targeted species than would be involved in the proposed experimental field trials.
6. Clearly, if the agent under study is determined to cause prolonged conscious suffering in poisoned animals, the researcher and/or the sponsor of the study may decide to euthanize such victims, terminate the study, and not pursue the use further.

In the course of my career, I have learned of a case in which dispatching of symptomatic individual inflated the apparent efficacy of an active ingredient to the point where the applicant proposed using a lower concentration of it in baits than ultimately was shown to be needed. In another case, euthanasia of symptomatic animals in a range-finding assay for acute toxicity of a rodenticide compound led to an underestimation of the range to use in the formal LD50 trial.

NOV 28 2014

Column E Explanation

1. Registration Number: 93-R-0434; Cust. ID 9193
2. Number of animals used in the study: 8
3. Species used in the study: Rabbits
4. Procedure explanation: Rabbits were ocularly infected with herpes simplex virus type 1 (HSV-1). 30 days later rabbits were thermally stressed by placing in an incubator at 60 °C for 25 minutes. Internal body temperature was monitored and rabbits were returned to room temperature when body temperature reached 41.7 °C. The rabbits were monitored for reactivated virus in tears and for recurrent herpes stromal keratitis (rHSK).
5. Scientific Justification: This project is directed at understanding the mechanisms by which herpes simplex virus type 1 (HSV-1) infects the eye, establishes, maintains, and reactivates from latency, and causes recurrent eye disease. Approximately 90% of adults worldwide harbor dormant HSV-1 and reactivation of herpes from dormancy leading to recurrent disease is a leading cause of infectious corneal blindness known as recurrent herpes stromal keratitis (rHSK). The rabbit eye model with spontaneous reactivation and recurrent eye disease is similar to the human situation. However, rHSK only occurs in <1% of rabbit eyes during latency. This study tries to establish a model in which ~60% of the rabbits develop recurrent eye disease that more closely mimics clinical disease. A thermal stress model of induced HSV-1 reactivation in mouse trigeminal ganglia (TG) was developed in 1992. The authors state: "Our selection of hyperthermia or heat stress as a possible induction trigger was based on the strong correlation between fever and HSV reactivation in humans. The internal body temperature they used for inducing reactivation was 43 °C. This study induces thermal stress and fever in rabbits to mimic the mouse model and human disease.

Carol G. Fik

Column E Explanation

Registration Number 93-R-0437

University of California, San Diego

72 Guinea Pigs used in category E study

Explain the procedure producing pain and/or distress: Guinea pigs are challenged with HSV-2. Nonimmune animals will develop vaginal HSV-2 disease, including erythema, vesicles, or ulcerated lesions. The most severe disease (ulcerated lesions) will usually occur only between days 5 and 8 postchallenge, and single or multiple individual vesicles will occur sporadically until the conclusion of the experiment, day 60 postchallenge, when animals are euthanized. Nonimmune animals may experience some discomfort (itchiness, tingling, or pain) in the initial prodrome stage of infection when virus is replicating at the infection site. Ulceration and subsequent healing of ulcers may or may not be accompanied by pain, itching, or tingling. Complications such as disseminated or CNS disease are not expected using the challenge dose in the guinea pig strain and age indicated. Immune animals may be protected from some or all of the discomfort or disease described above.

Provide scientific justification why pain/distress could not be relieved: Analgesia is not used after viral challenge as it can alter the natural course of the infection and skew the measurement of protection, which then could not be compared to previous measures of vaccine-mediated documented in the scientific literature. This would add a high degree of variability to experiments and invalidate the results and conclusions necessary for evaluating candidate vaccines for larger-scale preclinical or human clinical testing.

ATTACHMENT to APHIS FORM 7023, Federal Fiscal Year 2012/2013

3. The following are the locations where regulated animals were housed or used during the year [Section 2.36(b)(4)]:

(b) (7)(F)

COLUMN E EXPLANATION

The University of California at San Francisco is committed to using laboratory animals in such a way as to minimize pain or discomfort. The Committee reviews each project and many protocols have been redesigned to meet this goal. Attached are the explanations of the procedures producing pain or distress in the animals covered by Subchapter A - Animal Welfare and reported in column E during the period 10/1/12 through 9/30/13 and the reasons anesthetic, analgesic, or tranquilizing drugs would have adversely affected the procedures, results, or interpretations of the research. Separate Optional Column E form (1) is attached.

1. Registration Number: 93-R-0440

2. Number of animals used in this study: 371

3. Species (common name) of animals used in the study: New Zealand White Rabbit

4. Explain the procedure producing pain and/or distress.

Staphylococcus aureus, particularly community-associated methicillin-resistant *Staphylococcus aureus*, causes severe infections and high mortality rates, particularly in patients with pneumonia, sepsis and endocarditis. Rabbit models reproduce many of the important features of severe invasive staphylococcal infections as they occur in humans. Rabbits also exhibit pathogen-host specificities that are similar to humans. Our goal is to use the rabbit infection model to further define bacterial factors that are important in virulence and pathogenesis of pneumonia caused by *Staphylococcus aureus* and to test various therapeutic approaches (antibodies-based therapies, vaccination, antimicrobials) for treatment of these severe infections. To establish staphylococcal pneumonia, *S. aureus* is instilled endobronchially through a soft catheter positioned via an endotracheal tube into the lungs of an anesthetized animal. To establish staphylococcal skin abscess, *S. aureus* is injected intradermally. To establish prosthetic joint infection, *S. aureus* is injected into the knee joint intraoperatively during a total knee arthroplasty procedure. To establish staphylococcal sepsis, *S. aureus* is injected intravenously via the marginal ear vein. To establish staphylococcal endocarditis, *S. aureus* is injected intravenously in rabbits that had a polypropylene catheter inserted across the aortic valve.

5. Provide scientific justification why pain and/or distress could not be relieved. State methods or means used to determine that pain and/or distress relief would interfere with test results. (For federally mandated testing, see Item 6 below).

93x0440/and 9/99

Staphylococcal endocarditis, pneumonia, and bacteremia, skin abscess, prosthetic joint infection, are particularly severe infections, both in rabbits and in humans. Interventions short of euthanasia (e.g., administration of antibiotics) would invalidate the model by altering the natural progression of the disease which is under study, alter the pathophysiology or host response. For the rabbit models of endocarditis, pneumonia and bacteremia, deaths are not unexpected in these infection models and they cannot be accurately or reliably predicted in the individual animals. For the rabbit models of skin abscess and prosthetic joint infection, deaths are not expected because these infections are localized to injection site on the skin or the knee. In all five rabbit infection models, animals may manifest >15% weight loss, are moribund or otherwise unable to access food and water. Animals with these findings will be euthanized.

Subject: Annual Report of Research Facility from October 1st 2013 through September 30th 2014 USDA
Registration # 93-R-0504

Dear Regional Office Director:

We have attached our Annual Report (form 7023) pertaining to research activities at Aragen Biosciences, Inc. The use of covered animal species reported in USDA Category E (animal pain and/or distress without alleviation) is explained below.

Aragen is a Contract Research Organization and the Preclinical Research Services department performs research studies on behalf of clients in many disease models. One of the models is the *Clostridium difficile* (C.difficile) post-antibiotic colitis [also called C difficile associated disease (CDAD)] model. The efficacy of therapeutics as well as vaccines in the area of *Clostridium difficile* infection (CDI) is evaluated using Syrian Hamsters as the model organism. At Aragen, this model was used in studies to evaluate (1) therapeutic efficacy of test compounds in a model of CDAD (2) vaccine test compounds for protection of CDAD in immunized hamsters challenged with C.difficile spores. The efficacy and the vaccine models are slightly different, although the outcome expected from both are the same. Both models aim to show the efficacy of test compounds to protect the animal from the lethal effects of C.difficile infection. The efficacy model is of a shorter duration (two weeks) involving evaluation of the efficacy of the test compounds either prior to (prophylactic), or after (therapeutic) infection of the hamsters with C.difficile spores. Vaccine model is of a longer duration wherein the vaccine test compounds are administered to the animals at regular intervals and can extend beyond one month. In both models, disease is induced when the hamster is given a single dose of the antibiotic clindamycin, which disrupts the normal intestinal gut flora and conditions the animal to being impacted by CDAD. Groups of animals that are uninfected by C.difficile or infected by C.difficile, but not provided any treatment, are the controls used in the studies. All study animals were monitored daily at least twice per day post C.difficile infection during the acute phase for signs of disease including diarrhea, weight loss, piloerection, lethargy, and ambulatory discomfort. Animals that appeared moribund were immediately euthanized by CO₂ asphyxiation. For data analysis, these animals were considered to have succumbed to the lethal effects of CDAD.

In the research experiments performed by Aragen under the approval of its IACUC committee, the majority of the animals included in the studies manifested the rapid clinical symptoms of CDAD and either succumbed the disease before they could be euthanized, because they were found dead in their cage during the morning observation (Category E), or were humanely euthanized by CO₂ asphyxiation (Category D) when they were found to be moribund during the observation phase. Animals that received effective treatment and did not show any outward disease symptoms were humanely euthanized at end of the study and would be categorized under D. The animals that were in the Clindamycin administered control un-infected category and survived until the end of the study, were humanely euthanized at that time. These animals have been placed in Category C.

In nosocomial settings, CDI is considered to be the main cause of bacterial infectious diarrhea. In 10-24% of patients who develop antibiotic-associated diarrhea (AAD), 90-100% of those with antibiotic-associated Pseudomembranous Colitis (PMC) and 50-75% of those with antibiotic-associated colitis, *C. difficile* is implicated as the causative organism (extracted from Expert Rev Anti Infect Ther. 2012;10(12):1405-1423). Then, C. difficile can cause symptoms ranging from diarrhea to life-threatening inflammations of the colon. According to the Centers for Disease Control and Prevention, each year in the United States C. difficile is

93,20,520
35285-

responsible for tens of thousands of cases of diarrhea and *C. difficile* causes diarrhea linked to 14,000 American deaths each year. (ref: www.cdc.gov). The problem is getting worse. *C. difficile* isn't confined exclusively to hospitals. It's also a growing problem among otherwise healthy people. Although the infection can usually be controlled with antibiotics, virulent strains of *C. difficile* are now appearing that resist treatment with common medications. Any means of preventing *C. difficile* infection is expected to have significant benefits to society.

Assessment of treatments for *C. difficile* infection requires the use of live animals to mimic the physiologic disease state in humans. Currently, non-animal models have very limited utility for such studies, in part, because of the limited knowledge in disease etiology (i.e., it is currently not possible to recapitulate disease in non-animal models since we know very little about the mechanism of disease induction and progression in vivo).

There are four established small animal models of *C. difficile* associated disease - mouse, rat, hamsters and guinea pig. Amongst all these species, hamsters are a more clinically relevant model for CDAD. Unlike the mouse and rat models, which are more contrived model and these animals are naturally insensitive towards the *C. difficile* toxins, hamsters are a permissive host for the colonization of, and toxin production by, *C. difficile*. The disease produced is similar to that in humans. Thus the, golden Syrian hamster is the lowest vertebrate in which the full spectrum of symptoms including diarrhea (recognized as wet tail) and gross pathological changes to the colon (equivalent to PMC) following *C. difficile* infection are seen. Use of this model is seen as an established preclinical step before testing novel therapies in humans. Finally, hamsters have been used in other studies examining new therapeutics for CDAD, thus allowing comparison with those results.

The Principal Investigator as well as the Attending Veterinarian re-investigated the use of analgesics for these studies. Search in Pubmed, Google, AWIC as well as a searchable internet-based Guide for the Care and Use of Laboratory Animals (http://www.nap.edu/openbook.php?record_id=5140) websites failed to generate relevant articles or webpages on analgesics for *C. difficile* studies. Additionally, NCBI-PUBMED, did not present any new studies that supported the use of analgesic for the evaluation of treatment efficacies using this model. We again found the earlier instances of research wherein use of opioid analgesics in fact was found to be a risk factor in clinical studies of *C. difficile* infection leading to delayed release of toxins (Issa et al, 2008: Inflamm Bowel Disease: Volume 14, Mora et al, Am J Med Sci, 2012) and was associated with risk of delayed diagnosis of the infection (Tucker, 2008). Therefore it was decided to forgo the use of analgesics in these studies.

Please contact me at (b) (6), (b) (7)(C) if you require any information regarding this report.

(b) (6), (b) (7)(C)
(b) (6), (b) (7)(C)

DEC 1 - 2014

IACUC Approved Exceptions to USDA Regulations or Standards (FY 2014)

1. Controlled food or water intake (i.e., feeding less than once a day and/or watering less than twice a day for an hour each time).

8 non-human primates were on studies using controlled water intake. The animals received ad-libitum water and/or juice during the experimental sessions as behavioral reinforcement for executing the required tasks. Unrestricted water access must be provided one day every week and there must be at least four days of unrestricted access per month. If controlled water intake will exceed six continuous days the Animal Resource Program (ARP) vet staff must be notified. Water access should be provided at the end of the last day of controlled water intake, and may be removed during the last day of unlimited access. This period of water access must consist of at least 24 hours of unrestricted access.

2. Explanation of the E pain category procedures producing pain and distress and reasons pain relieving agents cannot be used.

In one study 14 rabbits are infected with pathogenic bacteria. No pain relieving agents can be used to eliminate this discomfort without interfering with the validity of the study. All pain relieving agents such as aspirin, ibuprofen or acetaminophen reduce inflammation and thus decrease resistance to infection.

In another study the use of prolonged restraint classifies the 19 rabbits in pain category E. Sedation was deemed inappropriate due to the study aim of blood collection over a 6 hour long period.

Stanford University
Registration #93-R-0004

Exceptions to Standards and Regulations under the Act:

Multiple Major Survival Surgeries (MMSS) – 9CFR, Subchapter A, §2.31:

1. Four Investigators were granted Stanford IACUC approval to perform two survival surgeries on nonhuman primates as part of the same experimental protocol. All surgeries were performed with appropriate anesthetic agents. During this reporting period, **seventeen (17)** nonhuman primates were used.

Husbandry Practices - 9CFR, Subchapter A, Subpart B, §3.28:

2. One investigator was granted Stanford IACUC approval to house Siberian dwarf hamsters (*Phodopus sungorus*) as continuous breeding male/female pairs. These Siberian dwarf hamsters are used in research to study brain development. The male hamsters contribute to pup care and are left with the dam and litter to reduce stress related neural damage which can lead to aberrant behavior, including cannibalism. During this reporting period **forty eight (48)** Siberian dwarf hamsters were housed as breeding pairs.

Water Control - 9CFR, Subchapter A, Subpart D, §3.83:

3. Three Investigators were granted Stanford IACUC approval to utilize nonhuman primate water control as a motivational tool. During this reporting period, **twenty two (22)** nonhuman primates were used.

Physical Restraint - 9CFR, Subchapter A, Subpart D, §3.81:

4. Three Investigators were granted Stanford IACUC approval to utilize nonhuman primate chair restraint during experimental procedures. The animals were removed at the end of the recording sessions. The maximum length of the recording sessions was 4 hours. During this reporting period, **seventeen (17)** nonhuman primates were used.

Summary of IACUC-Approved Exceptions

1. An investigator was granted Salk IACUC approval to perform multiple survival surgeries on non-human primates as part of the same experimental protocol. During this reporting period four animals were used.
2. An investigator was granted Salk IACUC approval to perform multiple survival surgeries on non-human primates as part of the same experimental protocol. During this reporting period zero animals were used.
3. An investigator was granted Salk IACUC approval to perform multiple survival surgeries on non-human primates as part of the same experimental protocol. During this reporting period four animals were used.
4. An investigator using non-human primates was granted Salk IACUC approval to utilize carefully monitored water control as a motivational tool. These animals were also chaired during experimental procedures and were removed at the end of the recording sessions (the average length of these sessions was five hours). During this period six animals were used.
5. An investigator using non-human primates was granted Salk IACUC approval to utilize carefully monitored water control as a motivational tool. These animals were also chaired during experimental procedures and were removed at the end of the recording sessions (the average length of these sessions was five hours). During this period four animals were used.

 ALLERGAN
RESEARCH AND DEVELOPMENT
ALLERGAN ANIMAL CARE AND USE COMMITTEE

TO: Robert M. Gibbens, DVM
Regional Director-Animal Care
Western Region

DATE: November 11, 2014

SUBJECT: Annual Report Exception Summary
Registration Number: 93-R-0067
Customer ID Number: 1168

The Allergan Animal Care and Use Committee has approved under protocol 433-100153-2013, Retinal Disease in Primates, an exception to the requirement that primates are to have access to water no less than twice daily for at least 1 hour each time. The exception is required for behavioral studies associated with this protocol. The animals involved received water daily and were monitored according to our water regulation policy. Three of the animals were removed from the study due to reaching one or more of our policies early endpoint criteria. The criteria in place (body score, weight loss, clinical pathology values) are designed to expedite removal of any animals prior to developing any level of distress. The noted animals were returned to the colony with full access to water without incident. All of the remaining animals on study maintained good health and body condition. No animals were determined to be in distress during the study. The total number of animals that were on water regulation for any time during the year was 35. All of the animals were cynomolgus macaques. These animals are included on line 9 of the annual report under category D.

University of California, Davis
Addendum to Annual Report of Research Facility

A. USDA Exemptions to Provisions of the Act:

The USDA Administrator granted an exception to the number of cesarean sections that can be performed on nonhuman primates. This exception applied to 45 animals during the reporting period.

Justification for Cesarean Sections:

Studies that focus on fetal inherited diseases, other illnesses, and various corrective therapies for these illnesses, require that the animals be delivered by cesarean section at a standardized time point. This is important for several reasons. First, the fetuses and newborns are valuable research animals from which substantial information will be obtained, and delivery by cesarean section decreases the risk of parturition-related mortality. In addition, animals that deliver spontaneously typically do so over a large range of gestational ages, which makes it very difficult to accurately assess a number of significant developmental, physiological, and behavioral milestones. Delivering the newborns by cesarean section is the optimal method for obtaining viable, healthy offspring without confounding variables.

The surgeries are performed by trained California National Primate Research Center (CNPRC) staff veterinarians. Animals are administered general anesthesia for the procedures, receive post-operative analgesics, and post-operative care is provided by the Primate Medicine staff at the CNPRC under the direction of staff veterinarians.

Justification for Multiple Cesarean Sections in the Same Animal:

Multiple cesarean sections are routinely performed on humans. Nonhuman primates that undergo comparable procedures at the CNPRC rarely have post-surgical complications and, as borne out by numerous years of experience (>20 years), are fertile post-operatively. Any animal with prior evidence of pregnancy complications is not included in this exception. Similar to humans, extensive years of experience indicate that post-operatively these animals do not exhibit any problems or ill health.

The practice has been to maintain a breeding colony of monkeys at the CNPRC that can provide the required number of pregnancies for research purposes. Using animals more than once reduces the number of animals that have to be bred. As an example, if 100 animals are used per year for these studies, and if these animals could not be returned to the breeding colony, it would be necessary to breed additional animals to replace these animals. The net effect of using animals only once would be that an increased number of nonhuman primates would be needed, and that many valuable, healthy research animals would be euthanized because of their surgical history. With multiple use, and using procedures routinely used in humans, these animals can remain productive for many years, thus reducing the number of animals overall that are needed. This exception allows for up to four cesarean sections per animal.

Reporting Period: October 1, 2013 - September 30, 2014

Note: exceptions were reported last year and are on-going

Exception to AWA Regulations (Watering-2 protocols):

1. Title and Section of Animal Welfare Regulations (9CFR, Subchapter A) for which an IACUC-approved exception was granted:

The ARC has approved a departure from 9 CFR Ch. 1 section 3.83 (Watering).

2. Description of and rationale for IACUC-approved exception:

The protocols include departures from the requirement to provide potable water "...no less than twice daily for at least 1 hour each time." See rationale below.

3. Species and number of animals affected by this exception:

Macaca mulatta (8 rhesus monkeys)

Rationale:

Protocol 1-Watering

A controlled program of access to water is in place for the purposes of both providing motivation and training to perform IACUC-approved visuomotor task and for learning the pole-and-collar technique for voluntarily entering and exiting their home enclosure and learning to sit comfortably in the experimental chair. The animals are not "deprived" of water. The Principal investigator (PI) works together with the institutional veterinarians and their veterinary and technical staff members to ensure the animals receive their daily water allocation. Records of water intake are maintained and are accessible to the veterinarian, IACUC, USDA and AAALAC. These parties routinely examine these records. In order to determine their baseline daily intake, untrained animals are offered a minimum of 100 ml/kg of water per day (approx. the volume of 3 soda cans) each for one week. Typically, 2 liters (over 1/2 gallon) of water is provided in bottles on the cage and left in the enclosure so it remains continuously accessible to the animals overnight. The next day a measurement is taken to determine how much water was actually consumed in that 24-hour period. This process is repeated until an accurate indication of their daily intake is established. Water offering is gradually decreased by 10-50 ml/kg (approx. the volume of a third to 1/2 of a soda can) per day until the animals begin to consistently perform the desired visuomotor tasks. In most cases all animals will receive at least 22ml/Kg/day (approx. the volume of 1/2 soda can). However, in the event that an animal is found to be under-motivated, he may receive slightly less water, a rare event that is always discussed and agreed upon in consultation with the veterinarian and/or IACUC prior to implementation. Under no circumstances are animals allowed to reach levels indicative of dehydration or changes in their renal indices on serum chemistry panels (e.g., increased BUN, creatinine, serum osmolality). This renal evaluation is performed prior to the decreased water intake and repeated, if necessary, as directed by the veterinarian. Water intake also is not reduced if the animal shows signs of lethargy or lack of appetite.

Positive reinforcement is used as well. Animals are rewarded with additional sips of water whenever they perform a visuomotor task correctly. Animals typically receive their normal allocation of water by

the time the tasks are finished. Else, supplemental fluid is provided at the end of the sessions, as required, to reach their normal intake. Typically, a fruit treat such as an orange is provided after each session as an additional positive reinforcement signal.

During periods when animals are not participating in experiments, they typically receive fluid *ad libitum* in their home enclosures from a hanging water bottle.

Fluid control is conducted in full accordance with the guidelines adopted by NIH in 1990, the standards in the *Guide for the Care and Use of Laboratory Animals*, and our own institutional policies.

Protocol 2 - Watering

Similarly to Protocol 1, water scheduling is done for the purposes of motivation and training to perform their IACUC-approved task and for learning to voluntarily enter and exit their home enclosures. Animals are not "deprived" of water and their health as well all procedures are closely monitored by the institutional veterinarians. Most animals typically are on a water schedule regime, whereby they receive a set amount of water from a bottle once a day. Sometimes the volume of water in the bottle may be large (e.g., 80 ml/kg/day), which is more than the animals are capable of drinking even when on free (*ad libitum*) water. Indeed, when this level of water is given, the bottle usually is seldom emptied throughout the day. However, because it is offered once a day, and the maximum volume is known, we refer to this procedure as "water scheduling".

Once the training stage is completed and the animals enter the study phase, they are typically given a minimum water-allowance of 22 ml/kg/day everyday (7 days a week). The 22 ml/kg/day is the minimum volume and includes the amount of water the animal receives during training. However, the actual amount is individualized. For example, if an animal will work for a larger amount of water (and most work for 30 ml/kg/day or more most of the time), then the animal will get that larger amount. Before each study session, the animals have limited access to water for up to a maximum of 22 hrs. Some animals work in the mornings and some in the afternoon. When animals are on "training holidays" such as over the weekend, they normally receive their daily water ration in the morning. For animals that work in the afternoon following a "training holiday," we have two ways of ensuring they get access to water less than 22 hours before they work. Either we divide the daily ration into two equal volumes given in the morning and late afternoon of the "training holiday" or they receive at least 5-10% of their daily water intake in the morning of the day they will work, but no more than 6 hours prior to going to work. For the morning top-up, the default volume is 10% of their daily water, although this may occasionally be reduced to as little as 5% of their daily water intake if evidence shows that a greater amount of water negatively impacts their willingness to work.

Whenever the animals are not working, they receive a supplement of water (on top of the 22 ml/kg/day) to bring the total daily intake to the average total received on days when they are on study (e.g., up to 30 ml/kg/day). If the animals are not scheduled for work the next day, they receive a greater volume of water (usually 40-60 ml/kg). A daily log of water consumption is kept for all animals and is available for inspection and evaluation as described for Protocol 1.

Requiring the animal to perform a task for which it receives a fluid reward is not unlike conditions in the wild, in which animals must forage, travel distances, solve problems, or otherwise work to obtain their water. Our monkeys are provided with regular and more than sufficient water every day throughout the week (e.g., 30 ml/kg/day is the equivalent of an average man drinking 2.7 quarts of water a day). Weight stability and task performance indicate that our water schedule is not only physiological, but also behaviorally sound.

93/K 0435

Exception to AWA Regulations (Multiple Survival Surgeries – 3 protocols):

1. Title and Section of Animal Welfare Regulations (9CFR, Subchapter A) for which an IACUC-approved exception was granted:

The ARC has approved a departure from §2.31.d.1.x (No animal will be used in more than one major operative procedure from which it is allowed to recover).

2. Description of and rationale for IACUC-approved exception:

See rationale below.

3. Species and number of animals affected by this exception:

Macaca mulatta (4 rhesus monkeys)

Sus scrofa (1 farm pig)

Rationale:

Protocol 1 – Multiple major survival surgery (monkeys; cephalic cylinders; eye coils)

A. Cephalic cylinders. This protocol calls for a maximum of 4 surgeries (local craniotomies) on a new animal in their first study and 3 surgeries per animal per subsequent study. If more surgeries are required (due to a greater than normal number of coil or cranial implant repair surgeries), prior consultation with the veterinarian and authorization from the IACUC are sought. The only exception to this would be if the surgery is a veterinary medical emergency, one whose delay will cause pain or distress for the animal. In such cases, the surgery would be done with the sole approval of the veterinarian followed by subsequent notification of the IACUC. More likely than not, animals will undergo far fewer than the maximum number of surgeries listed in the protocol.

Almost all of the studies described in this protocol require the surgical placement of a cephalic cap and scleral eye coils (in order to immobilize the head and record eye movements). Many experiments require the surgical placement of a recording chamber. For experiments in which the behavioral training will be quick and neural recordings will be made, all three devices can be surgically placed in one surgical procedure. Because the recording chambers require far greater maintenance because of the exposed dura (the membrane covering the brain), there is substantial benefit from postponing the implantation of the chambers as long as possible. Thus, for behavioral experiments or experiments in which neural recordings will be made, but in which the behavioral training could take many months, we surgically implant the head-cap and eye coils first and perform a second surgical procedure to implant the chamber or chambers at a later date, when the training has been completed and/or the critical baseline behavioral data has been obtained. Generally these surgeries will be 6-10 months apart. In some experiments, the use of an additional chamber may become necessary after recording from the original chamber(s). In these cases its implantation may be deferred to a later date, and always 6-18 months after the previous major surgery.

There are two other circumstances in which additional surgeries may be needed – and then only with the concurrence with the veterinarian and the IACUC. First, occasionally eye coils and or head-caps fail (break or crack) and need to be replaced or repaired in order to ensure that the implants are functioning safely and properly. Because the statistical strength in our experiments comes from within animal comparisons, an experiment cannot continue without these repairs. Secondly, dural thickening is a common tissue response secondary to chronic exposure. Therefore, in order to facilitate the placement of electrodes, thinning of the dura will also occasionally be done under general anesthesia: granulation tissue and regenerated periosteum will be removed by incision and suction under a dissecting microscope. There will be a maximum of 2 dural debriding sessions per monkey per year. However, in the past we have generally done 1 debriding every few years. Further, in order to minimize anesthetic episodes, we may use the time in which an animal is already under anesthesia for a cap or coil repair, to do a debriding. Thus, it is likely to be far less than 2 per animal per year.

The first surgical procedure a new animal goes through is the placement of the head-cap and eye coil (and chamber(s) if appropriate). If, as outlined above, the animal needs a chamber placed or a second

chamber placed, the animal could undergo a second or third surgical procedure. Given our repair rate (1 per animal per 2-4 years), I have proposed a maximum of 4 surgeries for a new animal for their first experiment. Usually, the implants remain intact across studies, so when an animal goes on to a new study, most likely they will not need an additional surgery. However, if the new experiment involves the animal performing the same task, but recording from a different region of the brain, then it is possible that two more surgical procedures could be performed – one to place the first chamber in the new location and a second to place a new chamber on the other side of the head. As above, assuming 1 repair surgery per animal per 2-4 years, there would be a maximum of 3 surgeries per animal for subsequent experiments. Note, that by using animals in multiple studies we minimize the total number of animals used by moving trained monkeys from one experimental group to another.

All surgeries are conducted under strictly aseptic conditions, with the animal under general (Isoflurane) anesthesia and mounted in a stereotaxic instrument. Animals receive veterinarian-prescribed opiate analgesics before and after surgery. After major protocols, animals are also given a NSAID such as Carprofen and antibiotics. As a general rule, we have the DLAM veterinary staff perform all drug-related duties (pre-op preparation, anesthesia and animal monitoring during the procedure, and post-op care) and the surgical preparation. Members of the lab perform the surgical procedure under the PI's supervision or the supervision of a veterinarian, if the PI is unavailable.

B. Eye Coil Procedures: If the scleral coils used to record eye movements are not to be implanted, ophthalmic ointment is applied to both eyes following administration of anesthesia to prevent corneal desiccation, otherwise, coils are surgically implanted for studying the oculomotor system in awake monkeys.

C. Cephalic Cap and Chamber Placement: Following the implantation of coils around one or both eyes, the animal is adjusted in the stereotaxic device to ensure the correct orientation of the head and to facilitate the correct placement of the remaining implants: the head-cap and recording chamber(s), which are made of high-grade stainless steel, titanium, poly-ether-ether-ketone (PEEK) or a copolymer resin (20% glass-filled Delrin 570). A midline incision is made through the skin over the cranium extending from the region of the external occipital protuberance to within a centimeter or two of the brow ridges. If necessary, the temporalis muscle is reflected or partially removed to gain access to the underlying periosteum. The periosteum is then cleaned and dried. When placing chambers, a trephine is used to remove a circular disc of bone from the cranium, taking care to ensure that the underlying dura is left intact. In the unlikely event that the dura is damaged sufficiently to allow herniation of cortex, the craniotomy is replaced, the groove filled with bone wax and, if possible, the entire area sealed with dental acrylic. Cranial implants are held in place with one of two methods: 1) a titanium headholder with 2-4 adjustable strips positioned stereotaxically, and the strips screwed to the skull; or 2) a dental acrylic (methyl methacrylate) cap is secured to the skull with stainless steel, titanium or ceramic screws. After a final cleaning with saline and/or hydrogen peroxide, the periosteum is dried and may be sealed with cyanoacrylate (Vetbond). A stainless steel, titanium, or copolymer resin plug (used to secure the head to the primate chair during experiments) will be positioned stereotaxically and then secured to the skull with dental acrylic, which bonds together all of the screws/bolts/strips to form a single robust implant. Edges of the acrylic are made as smooth as possible, using Teflon sheets, to prevent or minimize wound edge irritation. Recording chambers are positioned over the trephine hole stereotaxically and secured to the rest of the implant with dental acrylic, or, in the case of the titanium headholder, four nylon screws will be implanted in the skull using key slots, and the chambers bonded to them by acrylic. The wound edge is cleaned and sutures inserted to keep the skin closely apposed to the implant until healing has occurred. If necessary, modified V-plasty incisions may be used to ensure that the skin is closely aligned with the margin of the implant.

C. Dural Debriding Procedure:

For dural debriding, the animals are fully anesthetized. Recovery is accelerated by the use of anesthetic-reversing agents. In this procedure, sterile and supplies instruments such as curettes, dental probes and Q-tips are used to gently peel off layers of granulation (vascular scar) tissue over the dura.

Rationale:

Protocol 2 – Multiple Survival Surgeries

73 12 0435

The intent is to have animals undergo no more than 2-3 surgeries in their lifetimes. The first is to install the head holder and eye loops. The animals are then be trained on the experimental/behavioral tasks. Then the cylinder (at least one) is installed. At this point the animals are ready to commence the studies. For studies that require serial recording of brain areas, the chamber will be removed and another chamber installed. Electrophysiological experiments would commence again and data will be collected allowing for a comparison of brain activity between two areas. This totals 3 surgeries. For an animal in which parallel, multiple area, multiple neuron recordings will occur, they will experience only two surgeries; one to install the head holder and eye loops and the second to install the chambers (2-3).

Delay of cylinder implant

Our experience has shown that over many years the presence of a cylinder can lead to bone erosion, which in turn can weaken the entire explant. When training animals on complex tasks (which may take up to a year) this can be avoided by delaying the performance of craniotomies and the implant of the cylinder(s) until the animal has learned its visuomotor task.

Implant of an additional cylinder

After extensive measurements in a specific brain area have been performed in one animal it often becomes necessary to measure in other brain regions, to compare results from different brain areas within the same animal. For example, in certain complicated behavioral tasks, neuronal activity in some brain regions evolves over time as the animal learns the task. Comparing one brain region with another in the same animal yields very useful information about whether one area is responsible for the activity (or produces the changes) seen in the other area. Timing becomes critical between the two areas – which area is activated first? Since behavioral and thus neuronal timing is susceptible to inter-animal variability, these data are readily interpretable using a within subject design. Thus an additional cylinder implant is performed.

Explant repairs

Explants may occasionally fall off or have to be removed. In the rare event that this happens, a new explant may be placed.

The surgical procedures performed under this protocol consist of attaching a head holding device to the skull, implanting periorbital eye loops, creating craniotomy sites, and attaching recording cylinders over these craniotomy sites. These surgical procedures are required for the performance of visuomotor tasks and neurophysiological recording. Minor and/or major repair and/or replacement of the head holding device, the recording cylinders, and the screws and acrylic that hold them in place may have to be performed under this protocol. Removal and/or replacement of eye loop implants may also have to be performed under this protocol.

All procedures described above are conducted using appropriate and IACUC approved methods for anesthesia, pain relief and infection control.

Rationale:

Protocol 3 – Multiple Survival Surgeries

The animals undergo two laparotomy operations for two reasons:

- 1) The study design is an autotransplantation procedure to develop a pig model that will serve as a bridge to human clinical application. Autotransplantation is anticipated to be the method by which bioengineered intestine will be generated and clinically used in humans in the future.
- 2) Performing grafting experiments using autologous donor cells from other pigs would necessitate the use of immunosuppressive medications and carry a risk of rejection. These side effects may significantly diminish the success of the engraftments.

Pigs are allowed to acclimatize for 1 week after delivery while they have free access to water and chow. Pigs are fasted overnight, premedicated with buprenorphine, Carprofen, Ketamine, Atropine and Acepromazine and then are placed under general anesthesia. They are prepped and draped in a sterile fashion and placed on a heating pad. Pigs receive perioperative antibiotic prophylaxis. Pigs are connected to vital sign monitors and vital signs will be monitored continuously while under anesthesia. Pigs receive IV fluids throughout the procedures.

Pigs then undergo a small abdominal midline laparotomy. The omental sac is opened to expose the

9326435

small intestine. 50-80 percent of the mid small bowel will be resected by taking the mesenteric tissues between clamps and ligating vessels. From the proximal cut jejunum, a 5-10 cm segment is isolated with its mesenteric blood supply intact. A biocompatible spring is inserted into the isolated jejunal segment and the two ends sutured or surgically stapled with GIA stapler. The mesenteric slit is closed. The distal ileum is re-anastomosed with a single layer anastomosis. The mesenteric slit is closed. The abdomen is irrigated with saline solution and the bowel repositioned. Local anesthetic is injected in the subcutaneous tissue of the wound. The abdominal wall, fascial layer, subcutaneous tissue, and skin are closed in a routine manner.

The literature shows that even 80% of bowel resection is well tolerated in pigs due to their capacity to hypertrophy (enlarge) their remnant gut. Excision of over 80% to 95% has been described in the literature to cause symptoms of short bowel syndrome (diarrhea, dehydration, nutrient, bile acid and electrolyte losses) We can anticipate somewhat looser stool but no significant diarrhea with 80% small bowel resection. We give IV fluid if the pigs show signs of dehydration. Should there be intractable diarrhea, we would euthanize the affected animal and proceed in subsequent pigs with a lesser resection that has no side effects. The normal growth development of the pigs is temporarily delayed and there may be 5-8% weight loss over the first 10 -14 days until the gut has hypertrophied. Then we expect the animals to regain weight.

Postoperatively, pigs are continuously monitored until they are completely awake and ambulatory. They will receive appropriate postoperative pain medication. They will be allowed access to water and chow after surgery without a postoperative fast.

The pigs are weighed once before surgery, and daily after each operation for 2 weeks or until they have started to gain weight for 3 consecutive days, whichever is longer.

The resected intestine is used to establish methods to prepare intestinal epithelial and myofibroblast cell cultures during the following 2-6 weeks. After 2-6 weeks, each pig is again fasted overnight and undergoes a second laparotomy, again under general anesthesia. Premedications and antibiotics are used as above. Fibroblasts and mucosal epithelial cells are implanted in three different ways to limit the number of pigs needed: We use polyglycolic acid mesh and decellularized intestine as graft beds. Both materials are fully biocompatible and have been used in humans before. Each graft is about 4 x 2 cm or smaller in size. We seed the grafts with four different concentrations of cultured myofibroblasts and epithelial cells. The seeded grafts are placed such that they become vascularized. All three implantation techniques have been validated previously in rodents and canines by our team and are well tolerated.

At the end of the study, pigs are euthanized by injection of an overdose of pentobarbital after 2, 4 or 8 weeks to determine the development of new intestinal cell clusters. All implants and the restored intestinal segment are harvested.

Exception to AWA Regulations (Singly Housed - 1 protocol):

1. Title and Section of Animal Welfare Regulations (9CFR, Subchapter A) for which an IACUC-approved exception was granted:

The ARC has approved a departure from §3.81.a (The environment enhancement plan must include specific provisions to address the social needs of nonhuman primates of species known to exist in social groups in nature).

2. Description of and rationale for IACUC-approved exception:

See rationale below.

3. Species and number of animals affected by this exception:

Macaca mulatta (2)

92 R6435

Rationale:

Protocol 1 - Singly Housing

The overall objective of this research is to clarify the mechanisms by which neurons and the networks to which they are connected acquire and deal with visual information. Specifically, the goals are to understand how this information is used to drive eye-movements, how it is used in perception, as well as how it is used in cognitive functions, such as attention, memory and our internal representation of visual space.

The primary benefit of this research is to add to the growing understanding of how the brain processes information related to perception and action. The major premise is that a better understanding of neural function in normal primates will provide a basis for developing improved diagnostic and therapeutic techniques for dealing with the neurological problems of human patients. The specific issues that this work focuses on include visual attention, eye movement control, short-term memory and the representation of space. These can be affected by normal or pathological aging, or by a number of neurological and mental disorders. It is these problems that this work will help build a foundation for.

Our current studies can best be conducted on the rhesus monkey for a number of reasons. First, Rhesus monkeys are highly visual animals and their visual system, as well as many other brain systems, is similar to humans, both anatomically and physiologically. Second, they are intelligent primates proven capable of learning and performing challenging behavioral tasks that test higher cognitive functions. Third, there is a large body of evidence available on this animal's behavior in cognitive tasks, as well as its neuroanatomy and neurophysiology, with particular reference to the cerebral cortex and the eye-movement centers in the brainstem.

To achieve the scientific goals, it is essential that we conduct our experiments in awake, behaving subjects. They must be intelligent enough to perform the challenging behavioral tasks that we use. It is not possible to replace the rhesus monkey with a phylogenetically lower species, because they would not be able to perform the behavioral tests that we use to get at the higher cognitive functions of interest. We aim to pair-house the monkeys as much as possible; however there are a number of factors that sometimes preclude this from occurring.

- 1) When we have an odd number of animals, we are not able to pair-house one animal.
- 2) When an animal is required to be on main-line water per veterinary prescription and the other animal in the enclosure is being water-scheduled, we are unable to pair the animals.
- 3) For the immediate period after surgery, we do not pair the animals. We do so once the recovering animal is ready.
- 4) When both animals are water-scheduled, but one is getting a large volume (such as 800 ml or a full bottle), we pair house the animals for less time than normal - this allows the animal getting more water to have more time to drink the water.
- 5) When the animals are socially or behaviorally incompatible and pairing them would risk injury to one or both.
- 6) Other events (for example a change in the room that may affect the hierarchy), can sometimes lead us to separate the animals for a more prolonged time. However, when these occur, we attempt to get the animals back together as soon as possible.

UCSF REPORTABLE IACUC-APPROVED EXCEPTIONS

932040

adg 9/93

Reportable Exception - Exception From the Exercise/Psychological Well-being Plan

Species: Cynomolgus or Rhesus Macaque

Number of Animals Used: 6

DESCRIPTION: Primates will be divided into two categories based on study type: Behavioral studies (Category "A") and safety/toxicology studies (Category "B"). All category "B" primates may be pair-housed, following careful pair evaluations by enrichment staff. Category "A" primates may be individually housed once they are enrolled on active study.

Rational for category "A" primates:

- Access to neighbors for category "A" primates may be maintained through grooming bars or clear panels
- Primates in category "A" will be housed in a separate "behavioral suite" when possible (1-2 rooms) to minimize stress of cage movements and create and maintain a stable cohort hierarchy
- Primates assigned to this category may be singly housed from collection of baseline data until necropsy. Written behavioral assessments are performed approximately weekly until necropsy
- The lab will place established compatible pairs in category "B" study groups whenever possible so that the pairs may be maintained
- Primates will, on occasion, switch between categories. For example, primates from category "A" who do not respond to MPTP treatment may be switched to category "B" for a simple bio-distribution study. The animals may then be paired once reassigned to category "B". Alternatively, if the primate is switched from category "B" to "A", they may be singly housed once reassigned
- The lab will report animal I.D. numbers to LARC and to IACUC once assigned to study groups, stipulating to which category they belong. When quarterly weight reports are submitted for all study primates, they will be divided into categories "A" and "B", based on category assignment from the previous quarter

Reportable Exception - Maintaining Animals at Temp/Humidity Outside Standards, Not Providing Diurnal Lighting as Required

Species: Hamster

Number of Animals Used: 0 (No animals were used during this reporting period.)

DESCRIPTION: At approximately 3-6 months of age, 40 animals will undergo the hibernation experiment.

Female Turkish hamsters between 3-6 months of age will be housed individually in rat cages and placed in short day cycle (8 hours light/16 hours dark for 2 weeks).

10 of them (per experiment) will not undergo hibernation, and will be housed at controlled room temperatures

for the next 8 weeks.

30 out of the 40 animals (per experiment) will be placed in the cold room (4 degrees Celsius), also on a short day cycle, to induce hibernation. The animals will have food and water available to them at all times for consumption during their intermittent periods of arousal. The animals will hibernate for 8 weeks duration. The animals and their hibernation status will be checked every 24h by placing a small piece of paper on the back of the hibernating animals. The presence of the paper will confirm hibernation over the preceding 24h period.

After 8 weeks, 10 animals in hibernation will be euthanized by decapitation alone (this is due to very low respiratory and low circulatory rates which preclude the use of a chemical anesthetic.) and their heads collected for analysis of the teeth.

Another 10 hibernating animals will be taken out of the cold room and kept at room temperature, which will induce arousal after 1h. The aroused animals will then be euthanized by CO2 administration and decapitation or bilateral thoracotomy and heads will be collected for tooth analysis.

Another 10 animals will be taken out of the cold room and left at room temperature for 2 weeks, after which these 10 animals (post-hibernation) will be euthanized by CO2 administration and decapitation or bilateral thoracotomy and heads will be collected for tooth analysis.

Female Turkish hamsters between 3-6 months of age will be housed individually in rat cages and placed in short day cycle (8 hours light/16 hours dark for 2 weeks).

10 of them (per experiment) will not undergo hibernation, and will be housed at controlled room temperatures for the next 8 weeks.

30 out of the 40 animals (per experiment) will be placed in the cold room (4 degrees Celsius), also on a short day cycle, to induce hibernation. The animals will have food and water available to them at all times for consumption during their intermittent periods of arousal. The animals will hibernate for 8 weeks duration. The animals and their hibernation status will be checked every 24h by placing a small piece of paper on the back of the hibernating animals. The presence of the paper will confirm hibernation over the preceding 24h period.

After 8 weeks, 10 animals in hibernation will be euthanized by decapitation alone (this is due to very low respiratory and low circulatory rates which preclude the use of a chemical anesthetic.) and their heads collected for analysis of the teeth.

Another 10 hibernating animals will be taken out of the cold room and kept at room temperature, which will induce arousal after 1h. The aroused animals will then be euthanized by CO2 administration and decapitation or bilateral thoracotomy and heads will be collected for tooth analysis.

Another 10 animals will be taken out of the cold room and left at room temperature for 2 weeks, after which these 10 animals (post-hibernation) will be euthanized by CO2 administration and decapitation or bilateral thoracotomy and heads will be collected for tooth analysis.

93 R04H0/cad 9199

Reportable Exception - Not Cleaning/Sanitizing at Required Frequencies

Species: Voles

Number of Animals Used: 12

DESCRIPTION: Exposure to dirty bedding for sentinel surveillance

Cage changes occur once or twice a week depending upon how soiled they are. At cage change, a small amount of dirty bedding is placed in the sentinel animals' clean cage as a means of monitoring the health status of the colony of animals. There are two sentinel cages for every two racks. One cage houses a sentinel mouse and the other sentinel cage houses two sentinel voles. A small amount of dirty bedding is transferred weekly to each sentinel cage from each of the animals' cages located on that rack.

The sentinel mouse is screened quarterly using our standard serology panel and the voles are screened quarterly for ectoparasites and endoparasites. After cages are changed, all dirty cages are cleaned and sanitized in our cage wash facility.

Reportable Exception – Fluid Regulation – Section 3.83

Species: Rhesus Macaque

Number of Animals Used: 8

DESCRIPTION: Fluid or food regulation for behavioral training: The goal of our research is to understand the operation of the working brain. A necessary route to accomplishing this goal is to record the activity of single neurons during behavior. In our laboratory, and many others around the world, we do this by training these animals to perform simple tasks with fluid or food reinforcements. Eliciting good behavioral performance over a period long enough to acquire meaningful data requires strong motivation on the part of the animals. The most successful, humane, and scientifically valid way to attain this level of motivation is through fluid or food restriction. Note that individual animals will never be both food and fluid restricted at the same time.

Note: For this reporting period, the 8 animals noted above were on fluid restriction only.

Reportable Exception – Innovative Housing – Sections 3.84

Cynomolgus and Rhesus Macaque

Number of Animals Used: 55

In order to provide certain nonhuman primates with enhanced physical environments, members of these species are occasionally placed into large "play cages" or "activity modules". Typically nonhuman primates are rotated through such cages. The number of such animals varies, but is approximately 55 NHP during this reporting period. The hard surfaces of the play cages or activity modules are spot cleaned and all excreta or disease hazards removed between individuals. These enclosures are sanitized on a normal schedule. Because many of the NHP are paired housed, they constitute a single group of animals for health status. The rotations are often enough that full sanitation between individuals would require frequent dismantling of exercise cages and pens for sanitization and decrease the amount of time it is available for

animal use. Individual animals would receive much less opportunity for experiencing this enhanced caging. Clearly the result would decrease this institution's efforts and ability to invoke a creative and positive animal housing experience.

This reportable exception to Section 3.84 of the AWAR - innovative housing - was reviewed and approved by the IACUC at the April 19, 2005 convened meeting of the full committee. Therefore, this institution reports that as it relates to sanitation between individuals.

+++++

Reportable Exceptions – Food/Fluid Regulation – Section 3.129 and Section 3.130

Species: Guinea Pigs

Number of Animals Used: 0 (No animals were used during this reporting period.)

DESCRIPTION: The metabolism of the HP-13C agents, particularly the ketone bodies, used in this study may be affected in certain tissues by the fasting state of the animals. A small percentage of guinea pigs in these studies (10% or less) will be subjected to 24-hour fasts prior to HP-13C agent and MRSI scanning. Published studies indicate that enzymatic processes are changed maximally in various organs by a 24-hour fast. An additional 10 guinea pigs will be subjected to an overnight fast (16-hours, in conjunction with the water restrictions below) in order to study kidney function effects on certain HP 13-C metabolites.

To better understand the effects of kidney function on the metabolism of certain HP 13-C agents, a cohort of 10 guinea pigs will be studied under conditions of diuresis and anti-diuresis, before and after hydration with glucose-water. This will require a period of water restriction (maximum of 16-hours).

FEB 25 2015

Pair Housing Rabbits Deviation from USDA Floor Space Requirements

According to the 8th edition of the *Guide for the Care and Use of Laboratory Animals*:

"An appropriate housing space or enclosure should also account for the animals' social needs. Social animals should be housed in stable pairs or groups of compatible individuals unless they must be housed alone for experimental reasons or because of social incompatibility" (page 51)

"Appropriate social interactions among members of the same species (conspecifics) are essential to normal development and wellbeing (Bayne et al. 1995; Hall 1998; Novak et al. 2006). When selecting a suitable social environment, attention should be given to whether the animals are naturally territorial or communal and whether they should be housed singly, in pairs, or in groups. An understanding of species-typical natural social behavior (e.g., natural social composition, population density, ability to disperse, familiarity, and social ranking) is key to successful social housing.

Not all members of a social species are necessarily socially compatible. Social housing of incompatible animals can induce chronic stress, injury, and even death. Single housing of social species should be the exception and justified based on experimental requirements or veterinary-related concerns about animal well-being. In these cases, it should be limited to the minimum period necessary, and where possible, visual, auditory, olfactory, and tactile contact with compatible conspecifics should be provided. In the absence of other animals, enrichment should be offered such as positive interaction with the animal care staff and additional enrichment items or addition of a companion animal in the room or housing area. The need for single housing should be reviewed on a regular basis by the IACUC and veterinarian" (page 64)

In order to provide pair housing to rabbits using the VMU's existing caging, deviation from the minimum space requirements in the Guide and the Animal Welfare Regulations is necessary. Both documents recommend 3 sq. ft. for rabbits up to 4 kg, however, the VMU's cages have 5 sq. ft. of floor space.

It is believed that pair housing young rabbits reduces the stress of the new cage environment and the incidence of mucoid diarrhea associated with stress.

Pair housed young rabbits in existing 5 sq. ft. caging can be seen grooming one another, resting side by side, and sharing feed at the feeder demonstrating that the animals are content in the space provided.

The following procedures are followed for pair housing rabbits:

1. Pairs will be housed in 6 sq. ft. caging when available.
2. Rabbits received at 2.75 kg or less will be housed in compatible same-sex pairs. When paired rabbits become more than 3 kg in weight, they will be singly housed.
3. Rabbits that have undergone a surgical procedure will be housed singly until sutures are removed or for the remainder of the study, according to the needs of the study.
4. Investigators will be responsible for ensuring that pair housed animals are permanently identified if necessary for their study.
5. All animals are observed daily by VMU Animal Health Staff. Paired rabbits that begin to fight or aggressively compete for food will be separated and housed individually.

Subj: Amended Annual Report (APHIS 7023)

Dear Dr. Petervary,

In response to your letter dated January 16, 2015, attached please find our amended Annual Report of Research Facility for fiscal year 2014, indicating the number of rabbits affected by the IACUC-approved exception to the USDA cage standards. This information has been added as a notation at the bottom of the pair-housing policy, page 4 of the annual report (page 5 of the attachment).

Sincerely,

Jeffrey Gering, FACHE
Medical Center Director

RE: Annual Report for FY 2014: 93-V-0004

Dear Dr. Gering:

This letter is to notify you that the Annual Report your institution is required to submit to the USDA on animals used in research at your facility during fiscal year 2014 is incomplete.

The regulations specify that the annual report needs to:

"Assure that the facility is adhering to the standards and regulations under the Act, and that it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the IACUC. A summary of all such exceptions must be attached to the facility's annual report. In addition to identifying the IACUC-approved exceptions, this summary must include a brief explanation of the exceptions, as well as the species and number of animals affected;"

9 CFR § 2.36 (b)(3)

In your facility's annual report, exceptions are listed. It appears from the information provided that the total numbers of animals affected by these exceptions in Fiscal Year 2014 are not provided.

As soon as possible, please submit an addendum to your 2014 Annual Report to this agency providing the information on the numbers of animals affected. If you have any questions regarding this matter, please feel free to call this office at any time. Thank you.

Sincerely,

Nicolette Petervary, VMD

ASSURANCE STATEMENTS

- Professionally acceptable standards governing the care, treatment, and use of animals including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- Each principal investigator has considered alternatives to painful procedures.
- This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all such exceptions is attached to this annual report. In addition to identifying the IACUC-approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- The attending veterinarian for this research facility has appropriate authority to ensure the provision of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.
